Operating Systems

Most Operating System vendors provide patches and updates to their products. It is a best practice of NetBackup Quality Engineering to test with the latest patch level of the operating system when testing a platform. If a known problem exists on a specific service pack or patched OS level, this information will be identified in the tables below. Otherwise, it is likely that current patch versions of releases will work with NetBackup for the Operating Systems listed below unless otherwise noted. Symantec supports the standard un-altered kernel/Operating System levels as indicated in the table. Should an issue arise on a revised kernel, Operating System, or virtual system environment, Symantec support may request the recreation of the problem with the standard operating environment distribution.

"Backward Compatibility"
NetBackup 6.x client and media server are supported with NetBackup 7.x servers. See TechNote #325328 <http://support.veritas.com/docs/325328> for NetBackup 6.x OS Software Compatibility List.

"NetBackup Vault"
This option runs on the same operating systems and versions and in the same clustering environments as NetBackup except as noted in the NetBackup Release Notes. NetBackup restrictions and limitations related to systems, clusters, and peripherals also apply to Vault.
Exception: Vault does not support standalone drives.

"Data at Rest Key Management Service (KMS)"
This feature is a Master server-based symmetric key managment service that manages symmetric cryptography keys for tape drives that conform to the T10 standard (i.e. LTO4). Beginning in NetBackup 6.5.2 KMS is supported on all OS versions where the Master Server and Media Server are supported unless otherwise noted.

"Support Definitions"
Symantec Maintenance/Support only applies to Symantec Licensed Software, assuming you have a current Symantec Maintenance/Support subscription for such software and such Symantec Licensed Software is operating in configurations which Symantec designates as supported. Symantec Maintenance/Support does not cover (and we have no responsibility for) providing technical support, installation services or other services for any other software or hardware products. Also, Symantec is not obligated to provide Maintenance/Support when your Symantec Licensed Software is operating in configurations Symantec does not designate as supportable/supported. Please see the current Symantec Technical Support Policy and your Symantec license agreement for more information, terms and limitations.

"Supported Configurations"
For more information including technical notes regarding currently Symantec -supported configurations (such as operating system/levels, firmware levels, databases, devices, device drivers, applications, etc.), please refer to our website <http://www.symantec.com/enterprise/support/> Please note that while Symantec makes reasonable efforts to keep this information updated, we cannot assure that this information will be in all cases complete or the most current.

"Third Party Products"
Where your problem may be related to product(s) from a third party vendor with whom we have a cooperative or collaborative relationship on such product(s), then Symantec may work with that vendor towards resolving your reported problem. Where Symantec does not have such a support relationship in place with the third party vendor, or where the vendor ceases to support such product(s), then our ability to support Symantec Licensed Software operating with such vendor's product(s) may be limited, affected, or prevented (and such third party product(s) may cease to be part of Symantec -supported configuration(s)). Symantec support may be limited by the hardware or software vendor due to their support lifecycle. Should a vendor announce End of Support for a product, Symantec support may be limited.

2. PRIOR to NetBackup 7.0.1 a failure may occur during Share Resource Tree creation and restore of Solaris 10-Update 8, BMR clients, on SPARC (sun4u and sun4v) and x64 processor types. BMR is unable to create SRTs (network and media) using the Solaris 10-Update 8 media that Sun Microsystems recently released. In some cases, the SRT creation works. However, a BMR restore of the Solaris 10-Update 8 client might not complete successfully, and result in an unusable system. If you encounter this type of issue, use a Solaris 10, Update-7 SRT to perform a BMR-based restore of a Solaris 10, Update 8 server.

NetBackup Administration Consoles

If your NetBackup server has no graphics display capabilities, you must install an alternative administrative interface. It may also be desirable for various other configurations, such as mixed environments that use the Windows and the UNIX platforms.

The NetBackup Administration Console provides a graphical user interface through which the administrator can manage NetBackup. The interface can run on any NetBackup Java-capable system. For information on how to install the consoles, see the NetBackup Installation Guides. And for information on how to use the NetBackup Adminstration Console, see the NetBackup Administrator's Guide, Volume 1.

The NetBackup Remote Administration Console is an interface-only version of NetBackup for Windows that you can use to administer NetBackup servers from another computer. The computer that runs the NetBackup Remote Administration Console does not require NetBackup software.

The table below is a list of the platforms that support the NetBackup-Java Administration, Backup, Archive and Restore and the NetBackup Remote Administration Console user interface.

Bare Metal Restore (BMR)

General Information
* Bare Metal Restore Server (BMR server) is a feature of the Master Server.

BMR Boot Server
* BMR Boot Server is supported on the same Operating Systems as the BMR client. BMR Boot Server bitness is not relevant. I.E., a Windows x86 boot server can boot x86 and x64 servers and visa-versa.

BMR Boot Server Requirements
1. The Boot Server must be of the same OS as the clients that are being recovered. The Master and Boot Server can reside on the same server without issue. You can have multiple Boot Servers of the same OS registered to the Master Server.
2. The Boot Server can only support clients at the same OS release or lower than it is.
As an example, a Solaris 10 Boot Server can do Solaris 10 and Solaris 9 clients. A Solaris 10 Boot Server can support all supported versions of Solaris clients.
Windows 2003 Boot Server can do all supported Windows client versions (Windows XP, Windows 2003). It is considered the highest OS release version.
3. Boot Server should updated to the same NBU patch level as the Master Server. The Boot Server needs to be at the same NBU patch level or higher than the clients it supports.
4. Solaris clients can only network boot to a Solaris Boot Server on the same sub-net. All other clients do not have this restriction.
5. You must have a BMR Boot Server to create BMR bootable restore media. However, when using such media, a Boot Server is not required and is not part of the restore process.

Bare Metal Restore File System/Volume Manager Support

Listed in the table below are the available File Systems and Logical Volume Managers compatible with Bare Metal Restore 7.x. Support is conditional according to the published notes corresponding to the individual OS platforms.

The table below contains scenarios that have been thoroughly tested with NetBackup. Due to the number of combinations, it is not possible to test all combinations for compatbility. If a particular scenario is not listed, it may work fine, but has not been explicitly tested by Symantec.

Minimum NetBackup Level
The information in this column is the minimum level of NetBackup that must be installed on the BMR Client to support the associated OS platform.

OS	File Systems	Volume Managers	Striping, Mirroring, RAID	Minimum NetBackup Level	Notes
AIX 5.3 (TL5 and above)	JFS, JFS2 VxFS 4.x - 5.x	Native LVM, VxVM 4.x - 5.x	All	7.0	1. Qualification is done with VxVM 5.0 and VxVM 5.0 MP3. 2. If a Veritas Volume Manager managed disk has the Cross Platform Data Sharing (CDS) enabled and you map that disk to an IDE disk the CDS capability will be lost. For more information reference the VxVM Administrators Guide.
HP-UX 11.11 PA-RISC	HFS, JFS 3.3, VxFS 3.5	Native LVM, VxVM 3.5	All	7.0	1. BMR supports HP-UX versions that contain embedded versions of VxVM and VxFS; therefore, you do not have to install separate versions of VxVM and VsFS in an HP-UX SRT. 2. JFS 3.3 is the version of the Veritas File System (VxFS 3.3.2) shipping on HP-UX since December 1999.
HP-UX 11.31 IA64	HFS, JFS, VxFS	Native LVM, VxVM 5.0	All	7.0.1	Support is limited for LVM and VxVM 1. For DDR operation, only volume size changing is supported. Re-mapping to different disks is not supported. 2. In case of VxVM, support is only the self restore of non-root/boot volumes.
Red Hat 4.x (x64) and Red Hat 5.x (x64)	EXT2, EXT3, Reiserfs	Native Partitioning, Native LVM	Striping, Mirroring, MultiDevices all layouts	7.0	1. Support for Linux multidevices is limited, and BMR may not restore some configurations exactly. 2. If the root file system is created on a Linux multidevice, when performing a dissimilar disk restore you must map the root file system and retain the original level (for example, if the original level is RAID-1 the mapped file system must also be RAID-1). If the level is changed, the kernel may panic and the system may not recover. 3. To perform system-only restores on Linux systems, use the dissimilar disk restore feature to map the original system volumes to the target disks (even if you are performing a normal self restore). 4. Linux Native-Multipathing is not handled.

OS	File Systems	Volume Managers	Striping, Mirroring, RAID	Minimum NetBackup Level	Notes
Solaris 9 and Solaris 10 SPARC	UFS, VxFS 4.1 MP2 and higher	SVM, VxVM 4.1 MP2 and higher	All	7.0	1. Qualification is done with VxVM 5.0 and VxVM 5.0 MP3. 2. If a Veritas Volume Manager managed disk has the Cross Platform Data Sharing (CDS) enabled and you map that disk to an IDE disk the CDS capability will be lost. For more information reference the VxVM Administrators Guide. 3. SVM database replicas, disk sets, and volumes are fully recreated and SVM remains active after a BMR restore. 4. For mixed versions of VxVM and VxFS, install the latest version of the Symantec licensing software into the SRT. 5. VxVM/VxFS cannot be patched in SRT.
Solaris 10 x64	UFS, VxFS 5.0 and higher	SanBoot, SVM, Solaris Zones, VxVM 5.0 and higher	All	7.0	1. Qualification is done with VxVM 5.0 and VxVM 5.0 MP3. 2. Support for Solaris native SVM was added in NetBackup 7.0.1. 3. Support for SAN boot was added in NetBackup 7.0.1. 4. Support for Solaris Zones was added in NetBackup 7.0.1 5. SAS based client are supported. Support for SATA disk based client was added in NetBackup 7.0.1.
Windows Server 2003 x86 (32-bit)	FAT32, NTFS	Windows LDM	All	7.0	
Windows Server 2003 x86 (32-bit)	FAT32, NTFS	SFW 4.0 - 4.3	All	7.0	Need to use DOS boot mechanism in order to restore SF involved clients.
Windows Server 2003 x64 (64-bit)	FAT32, NTFS	Windows LDM	All	7.0	No support for SFW on this platform.

Acrynoms
LDM - Logical Disk Manager
LVM - Logical Volume Manager
SFW - Storage Foundation for Windows
SVM - Solaris Volume Manager
VxFS - Vertas File System
VxVM - Veritas Volume Manager

SAN Media Server/SAN Client/FT Media Server

Unless otherwise noted the minimum NetBackup level for SAN Client support is NetBackup 6.5 GA.

SAN style backups via SAN Media Server

SAN media servers are NetBackup media servers that back up their own data. SAN media servers cannot back up data that resides on other clients. SAN media servers are useful for certain situations. For example, a SAN media server is useful if the data volume consumes so much network bandwidth that it affects your network negatively.

* Enables LAN-free data protection with high performance access to shared resources
* Can share tape resources with NetBackup Master and Media Servers
* Can only back itself up, not other clients
* Software is installed stand alone on each cluster node and linked to the virtual host via an application cluster
* When you define a backup policy for a SAN media server, add only the SAN media server as the client.
* The NetBackup Shared Storage Option is able to use NetBackup SAN media servers.

There is no platform restriction regarding SAN Media Servers - any Media Server can be a SAN Media Server. The only difference is in the license authentication mechanism. Application and DB Agents are supported with the SAN Media Server.

SAN style backups via SAN Client

A NetBackup SAN client is a NetBackup client on which the Fibre Transport service is activated. The SAN client is similar to the SAN media server that is used for the Shared Storage Option; it backs up its own data. However, the SAN client is based on the smaller NetBackup client installation package, so it has fewer administration requirements and uses fewer system resources.

* It connects to a NetBackup media server over Fibre Channel.
* The NetBackup SAN Client Fibre Transport Service manages the connectivity and the data transfers for the FT pipe on the SAN clients. The SAN client FT service also discovers FT target mode devices on the NetBackup media servers and notifies the FT Service Manager about them.
* Requires SAN connectivity with a Media Server running Fibre Transport Services (reference additional information below in regards to the FT Media Server)
* Enterprise Vault (EV) Agent is NOT Supported with SAN Client. All other Application and DB Agents are supported with the SAN Client

FT Media Server

A NetBackup FT media server is a NetBackup media server on which the Fibre Transport services are activated. NetBackup FT media servers accept connections from SAN clients and send data to the disk storage. The host bus adapters (HBAs) that accept connections from the SAN clients use a special NetBackup target mode driver to process FT traffic. The media server FT service controls data flow, processes SCSI commands, and manages data buffers for the server side of the FT pipe. It also manages the target mode driver for the host bus adaptors.

NetBackup Virtual Systems Compatibility

This Statement of Support for NetBackup in a Virtual Environment document describes the extent of support for NetBackup within a virtual environment. Ideally, every NetBackup configuration supported in a traditional physical environment would also be supported in any virtual environment without qualification. While that is our mission, it is not always possible.
Therefore, the purpose of this document is to:
* Clarify differences between NetBackup support in physical vs. virtual environments
* Describe general guidelines for support in virtual environments
* Describe impact upon specific NetBackup components: clients, servers, options, etc.
* Provide references to related information

Virtual Systems Compatibility - See TechNote #340091 Statement of Support for NetBackup in a Virtual Environment: <http://entsupport.symantec.com/docs/340091>
